Advanced Processing, Properties, and Applications of Starch and Other Bio-based Polymers presents the latest cutting-edge research into the processing and applications of bio-based polymers, for novel industrial applications across areas including biomedical and electronics. The book is divided into three sections, covering processing and manufacture, properties, and applications. Throughout the book, key aspects of sustainability are considered, including improved utilization of available natural resources, sustainable design possibilities, cleaner production processes, and waste management. Focuses on starch-based polymers, examining the latest advances in processing and applications with this valuable category of biopolymer Highlights industrial sustainability considerations at all steps of the process, including when sourcing materials, designing and producing products, and dealing with waste Supports the processing and development of starch and other bio-based polymers with enhanced functionality for advanced applications

What does "excellent manufacturing management" mean? Management texts to date have emphasized that it is, above methods such as SPC or TQM, a matter of "intangibles" and "culture". This book takes the myth out of management excellence; it can be learned and practiced. First, manage the three core processes, strategy deployment, product and process development, and the supply chain. And secondly, pay attention to the dimension of management quality, direction setting, integration and delegation, communication, participation, measurement, and employee development. This book explains management quality and demonstrates how it is implemented, with ten plant tours through world-class factories from different industries.

This book shows how jute waste is collected from industry and used as a cheaper source to extract and use cellulose. Novel environment-friendly methods are explored for surface modification of natural fibers. The advantages of using biocomposites are listed and the author shows how they can be used effectively as secondary structural parts.

Natural fibers and their composites have a long and important place in the history of human creativity and industry. Increasing consumer interest in "green" products made with sustainable materials, along with the rising cost of petroleum - the basic ingredient of synthetic fibers - have once again brought natural fibers and their composites to the fore. The renewed interest in natural fibers is only a few decades old. Thus, the pioneering work of current researchers in this new era of natural fiber composites will help to illuminate the path for future researchers as they explore new potentialities for natural fibers. Sabu Thomas and Laly Pothan, themselves leaders in the field, bring together cutting edge research by eminent scientists in Natural Fiber Reinforced Composites. Covering the latest research trends such as nano technology, the book will be a valuable resource for the natural fiber composite researcher.
