This first book of its kind tells the behind-the-scenes story of the incredibly illegal Cannonball rally. This best seller is now available in paperback!In the early 1970s, Brock Yates, senior editor of Car and Driver Magazine, created the now infamous Cannonball Sea-to-Shining-Sea Memorial Trophy Dash; a flat out, no-holds-barred race from New York City to Redondo Beach, California. Setting out to prove that well trained drivers could safely navigate the American highways at speeds in excess of the posted limits, Mr. Yates created a spectacle reminiscent of the glory days of the barnstorming pilots. Filled with fascinating unpublished stories, nostalgic and modern-day photographs, inside information and hilarious stories from this outrageous and incredibly immoral rally. Brock is one of the best-known, most respected automotive journalists in the world today.

A morbidly fascinating and articulate collection of essays, this book explores the grim underside of America's cult of the automobile and the disturbing, frequently conspiratorial, speculations that arise whenever the car becomes the cause or the site of human death. Through analysis of fatal celebrity car accidents and other examples of death by automobile, as well as through personal memoir and forensic reports, cultural critics ponder our very human fascination with the car crash. Topics include the roles and experiences of passengers and bystanders, car crash conspiracy theories, the automobile as a site of murder, studies of car crash cinema, and psychological interpretations of the notion of the 'accident.' The book features original essays by such underground icons as Kenneth Anger and Adam Parfrey.

Since the first model in 1948 Holden has transcended the bounds of being a product or a brand. This year Holden celebrates 60 years of the best selling Aussie family car of all time and this book looks at what it is like to be a Holden owner.

"This pioneering study of United States direct investment in Japan will interest academic specialists, business managers, and government policymakers in America, Japan, and elsewhere. Drawing on rich historical materials from both sides of the Pacific, including corporate records and government documents never before made public, Mason examines the development of both Japanese policy towards foreign investment and the strategic responses of American corporations. This history is related in part through original case studies of Coca-Cola, Dow Chemical, Ford, General Motors, International

Business Machines, Motorola, Otis Elevator, Texas Instruments, Western Electric, and Victor Talking Machine. The book seeks to explain why s little foreign direct investment has entered modern Japan. In contrast to the widely held view that emphasizes an alleged lack of effort on the part of foreign corporations, this study finds that Japanese restrictions merit greater attention. Many analysts of the modern Japanese political economy identify the Japanese government as the key actor in initiating such restrictions. Mason finds that the influence of Japanese business has often proved more potent than these analysts suggest. This book offers fresh insights into both the operation of the modern Japanese political economy and of its relations with the world economy."

This two-volume set (LNAI 11055 and LNAI 11056) constitutes the refereed proceedings of the 10th International Conference on Collective Intelligence, ICCCI 2018, held in Bristol, UK, in September 2018 The 98 full papers presented were carefully reviewed and selected from 240 submissions. The conference focuses on knowledge engineering and semantic web, social network analysis, recommendation methods and recommender systems, agents and multi-agent systems, text processing and information retrieval, data mining methods and applications, decision support and control systems, sensor networks and internet of things, as well as computer vision techniques.

The importance of having ef cient and effective methods for data mining and kn- ledge discovery (DM&KD), to which the present book is devoted, grows every day and numerous such methods have been developed in recent decades. There exists a great variety of different settings for the main problem studied by data mining and knowledge discovery, and it seems that a very popular one is formulated in terms of binary attributes. In this setting, states of nature of the application area under consideration are described by Boolean vectors de ned on some attributes. That is, by data points de ned in the Boolean space of the attributes. It is postulated that there exists a partition of this space into two classes, which should be inferred as patterns on the attributes when only several data points are known, the so-called positive and negative training examples. The main problem in DM&KD is de ned as nding rules for recognizing (cl- sifying) new data points of unknown class, i. e. , deciding which of them are positive and which are negative. In other words, to infer the binary value of one more attribute, called the goal or class attribute. To solve this problem, some methods have been suggested which construct a Boolean function separating the two given sets of positive and negative training data points.
