Condition Monitoring: Definition, Types, Needs ...

Condition monitoring is the process of monitoring conditions in machinery such as vibration and temperature to look for signs that a fault may be developing. Condition monitoring is more efficient than reactive maintenance since faults can generally be avoided, thus reducing machine downtime, saving money and prolonging the life of the machine.

Condition monitoring can be used to develop a smart maintenance plan to shut down the machinery and repair or replace a part only when needed. Such a plan is known as a condition-based maintenance plan or predictive maintenance plan, instead of relying on historical data and associated crude life estimation, which is known as time-based maintenance or preventive maintenance.
