The Data Encryption Standard (DES / , d i: , i: ' e s, d e z /) is a symmetric-key algorithm for the encryption of digital data. Although its short key length of 56 bits makes it too insecure for applications, it has been highly influential in the advancement of cryptography.. Developed in the early 1970s at IBM and based on an earlier design by Horst Feistel, the algorithm was ...

ACNS2008, the 6th International Conference on Applied Cryptography and Network Security, was held in New York, New York, June 3-6, 2008, at Columbia University. ACNS 2008 was organized in cooperation with the International Association for Cryptologic Research (IACR) and the Department of Computer Science at Columbia University. The General Chairs of the conference were G. Keromytis and Moti Yung. The conference received 131 submissions, of which the Program Committee, chaired by Steven Bellovin and Rosario Gennaro, selected 30 for presentation at the conference. The Best Student Paper Award was given to Liang Xie and Hui Song for their paper "On the Effectiveness of Internal Patch Dissemination Against File-Sharing Worms" (co-authored with Sencun Zhu). These proceedings consist of revised versions of the presented papers. The revisions were not reviewed. The authors bear full responsibility for the contents of their papers. There were many submissions of good quality, and consequently the selection process was challenging and very competitive. Indeed, a number of good papers were not accepted due to lack of space in the program. The main considerations in selecting the program were conceptual and technical innovation and quality of presentation. As reflected in the Call for Papers, an attempt was made to solicit and publish papers suggesting novel paradigms, original directions, or non-traditional perspectives.
