Find the mean, median, mode, and range for the following list of values: 1, 2, 4, 7. The mean is the usual average: $(1 + 2 + 4 + 7) \div 4 = 14 \div 4 = 3.5$. The median is the middle number. In this example, the numbers are already listed in numerical order, so I don't have to rewrite the list. But there is no "middle" number, because there are an ...

Since there are an even number of values, the median will be the average of the two middle numbers, in this case 23 and 23, the mean of which is 23. Note that in this particular data set, the addition of an outlier (a value well outside the expected range of values), the value 1,027,892, has no real effect on the data set.

The terms mean, median, mode, and range describe properties of statistical distributions. In statistics, a distribution is the set of all possible values for terms that represent defined events. The value of a term, when expressed as a variable, is called a random variable. There are two major types of statistical distributions.

What are Mean, Median, Mode and Range?

Finding the Mean, Median, Mode and Range The three distinct calculations associated with the Measure of Central Tendency are the Mean, Median, and Mode. Each measurement is an attempt to capture the essence of how a typical entry or number in the data set may look like.

Mean, Median, Mode, Range, Interquartile Range Mean The 'Mean" is the average of a set of numbers. The "Mean" is computed by adding all of the numbers in the data together and dividing by the number of elements contained in the data set. Example: Data Set = 2, 5, 9, 7, 5, 4, 3 Number of Elements in Data Set = 7 Mean = (2 + 5 + 9 + 7 + 5 + 4 + 3) / 7 = 5 Median The "Median" is the ...

Mean, Median, Mode and Range Worksheets

Mean, median and mode are all measures of central tendency in statistics. In different ways they each tell us what value in a data set is typical or representative of the data set. The mean is the same as the average value of a data set and is found using a calculation. Add up all of the numbers and divide by the number of numbers in the data set.

If you have the numbers 125, 65, 40, 210 and 65, the average would be 101, or the total of all five numbers (505) divided by the number of data points (five). The median and mode methods, however, would produce different answers than the mean. For both, the average would be 65. For another example, view the video below:

The mean is (5+6+6+6+6+7) ÷ 6 = 36/6 = 6. The mode is 6, because there are more sixes than any other number. The median is 6, because if the six numbers are written in either descending or ascending order, the average of the two middle numbers (6 and 6) is 6.

The Mode . In statistics, the mode in a list of numbers refers to the integers that occur most frequently. Unlike the median and mean, the mode is about the frequency of occurrence. There can be more than one mode or no mode at all; it all depends on the data set itself. For example, let's say you have the following list of numbers:

The goal of this book is multidimensional: a) to help reviving Statistics education in many parts in the world where it is in crisis. For the first time authors from many developing countries have an opportunity to write together with the most prominent world authorities. The editor has spent several years searching for the most reputable statisticians all over the world. International contributors are either presidents of the local statistical societies, or head of the Statistics department at the main university, or the most distinguished statisticians in their countries. b) to enable any non-statistician to obtain quick and yet comprehensive and highly understandable view on certain statistical term, method or application c) to enable all the researchers, managers and practicioners to refresh their knowledge in Statistics, especially in certain controversial fields. d) to revive interest in statistics among students, since they will see its usefulness and relevance in almost all branches of Science.
