Research on gene drive systems is rapidly advancing. Many proposed applications of gene drive

research aim to solve environmental and public health challenges, including the reduction of poverty and the burden of vector-borne diseases, such as malaria and dengue, which disproportionately impact low and middle income countries. However, due to their intrinsic qualities of rapid spread and irreversibility, gene drive systems raise many questions with respect to their safety relative to public and environmental health. Because gene drive systems are designed to alter the environments we share in ways that will be hard to anticipate and impossible to completely roll back, questions about the ethics surrounding use of this research are complex and will require very careful exploration. Gene Drives on the Horizon outlines the state of knowledge relative to the science, ethics, public engagement, and risk assessment as they pertain to research directions of gene drive systems and governance of the research process. This report offers principles for responsible practices of gene drive research and related applications for use by investigators, their institutions, the research funders, and regulators.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

Completely revised in 2019 to reflect grade-level standards, Daily Word Problems is the perfect resource to improve students problem-solving skills. Four miles southeast of the village of Matfield Green in Chase County, Kansas—the heart of the Flint Hills—lies the abandoned settlement of Thurman. At the turn of the century Thurman was a prosperous farming and ranching settlement with fifty-one households, a post office, two general stores, a blacksmith shop, five schools, and a church. Today, only the ruins of Thurman remain. Joseph Hickey uses Thurman to explore the settlement form of social organization, which—along with the village, hamlet, and small town—was a dominant feature of nineteenth- and early twentieth-century American life. He traces Thurman's birth in 1874, its shallow rises and falls, and its demise in 1944. Akin to what William Least Heat-Moon did for Chase County in *Prairie Earth*, Hickey provides a "deep map" for one

post-office community and, consequently, tells us a great deal about America's rural past. Describing the shifting relationships between Thurmanites and their Matfield Green neighbors, Hickey details how social forces set in motion by the American ideal of individualism and the machinations of capitalist entrepreneurs produced a Darwinian struggle between Thurman stock raisers and Flint Hills "cattle barons" that ultimately doomed Thurman. Central to the story are the concept of "ordinary entrepreneurship" and the profoundly capitalist attitudes of the farmers who settled Thurman and thousands of other communities dotting the American landscape. Hickey's account of Thurman's social organization and disintegration provides a new perspective on what happened when the cattle drives from Texas and the Southwest shifted in the 1880s from the Kansas cowtowns to the Flint Hills. Moreover, he punctures numerous myths about the Flint Hills, including those that cattle dominated because the land is too rocky to farm or that Indians refused to farm because of traditional beliefs. Like many other small rural communities, Hickey argues, Thurman during its seventy-year history was actually several different settlements. A product of changing social conditions, each one resulted from shifting memberships and boundaries that reflected the efforts of local entrepreneurs to use country schools, churches, and other forms of "social capital" to gain advantages over their competitors. In the end, Thurman succumbed to the impact of agribusiness, which had the effect of transforming social capital from an asset into a liability. Ultimately, Hickey shows, the settlement's fate echoed the decline of rural community throughout America.

A synthesis of research and theory, this work chronicles the dawn of a new era in which the adaptability and autonomy of living organisms becomes the model for human made systems and machines. The author combines ideas from the Chaos Theory, cybernetics, current thinking on evolution and research into computerized artificial life with his own experience of on-line culture to show that industrial culture is now obsolete. This book presents the prospects of imminent revolution as Kelly identifies new frontiers of thinking about biological systems that will change the way the natural world is perceived.

"A book that offers hope." —The New York Times Book Review "A wondrous tapestry." —Carl Safina, author of *Beyond Words: What Animals Think and Feel* Audubon Medal winner Richard Louv's landmark book *Last Child in the Woods* inspired an international movement to connect children and nature. Now he redefines the future of human-animal coexistence. In *Our Wild Calling*, Louv interviews researchers, theologians, wildlife experts, indigenous healers, psychologists, and others to show how people are connecting with animals in ancient and new ways, and how this serves as an antidote to the growing epidemic of human loneliness; how dogs can teach children ethical behavior; how animal-assisted therapy may yet transform the mental health field; and what role the human-animal relationship plays in our spiritual health. He reports on wildlife relocation and on how the growing populations of wild species in urban areas are blurring the lines between domestic and wild animals. *Our Wild Calling* makes the case for protecting, promoting, and creating a sustainable and shared habitat for all creatures—not out of fear, but out of love. Includes a new interview with the author, discussion questions, and a resource guide.

A potent new book examines the overlap between our ecological crisis and video games Video games may be fun and immersive diversions from daily life, but can they go beyond the realm of entertainment to do something serious—like help us save the planet? As one of the signature issues of the twenty-first century, ecological deterioration is seemingly everywhere, but it is rarely considered via the realm of interactive digital play. In *Playing Nature*, Alenda Y. Chang offers groundbreaking methods for exploring this vital overlap. Arguing that games need to be understood as part of a cultural response to the growing ecological crisis, *Playing Nature* seeds conversations around key environmental science

concepts and terms. Chang suggests several ways to rethink existing game taxonomies and theories of agency while revealing surprising fundamental similarities between game play and scientific work. Gracefully reconciling new media theory with environmental criticism, *Playing Nature* examines an exciting range of games and related art forms, including historical and contemporary analog and digital games, alternate- and augmented-reality games, museum exhibitions, film, and science fiction. Chang puts her surprising ideas into conversation with leading media studies and environmental humanities scholars like Alexander Galloway, Donna Haraway, and Ursula Heise, ultimately exploring manifold ecological futures—not all of them dystopian.
