The first volume focusing on film music as a worldwide phenomenon

Musical Minorities is the first English-language monograph on the performing arts of an ethnic minority in Vietnam. Living primarily in the northern mountains, the Hmong have strategically maintained their cultural distance from foreign invaders and encroaching state agencies for almost two centuries. They use cultural heritage as a means of maintaining a resilient community identity, one which is malleable to their everyday needs and to negotiations among themselves and with others in the vicinity. Case studies of revolutionary songs, countercultural rock, traditional vocal and instrumental styles, tourist shows, animist and Christian rituals, and light pop from the diaspora illustrate the diversity of their creative outputs. This groundbreaking study reveals how performing arts shape understandings of ethnicity and nationality in contemporary Vietnam. Based on three years of fieldwork, Lonán Ó Briain traces the circulation of organized sounds that contribute to the adaptive capacities of this diverse social group. In an original investigation of the sonic materialization of social identity, the book outlines the full multiplicity of Hmong music-making through a fascinating account of music, minorities, and the state in a post-socialist context.

Foundations of Algorithms, Fifth Edition offers a well-balanced presentation of algorithm design, complexity analysis of algorithms, and computational complexity. Ideal for any computer science students with a background in college algebra and discrete structures, the text presents mathematical concepts using standard English and simple notation to maximize accessibility and user-friendliness. Concrete examples, appendices reviewing essential mathematical concepts, and a student-focused approach reinforce theoretical explanations and promote learning and retention. C++ and Java pseudocode help students better understand complex algorithms. A chapter on numerical algorithms includes a review of basic number theory, Euclid's Algorithm for finding the greatest common divisor, a review of modular arithmetic, an algorithm for solving modular linear equations, an algorithm for computing modular powers, and the new polynomial-time algorithm for determining whether a number is

prime. The revised and updated Fifth Edition features an all-new chapter on genetic algorithms and genetic programming, including approximate solutions to the traveling salesperson problem, an algorithm for an artificial ant that navigates along a trail of food, and an application to financial trading. With fully updated exercises and examples throughout and improved instructor resources including complete solutions, an Instructor's Manual and PowerPoint lecture outlines, Foundations of Algorithms is an essential text for undergraduate and graduate courses in the design and analysis of algorithms. Key features include: • The only text of its kind with a chapter on genetic algorithms • Use of C++ and Java pseudocode to help students better understand complex algorithms • No calculus background required • Numerous clear and student-friendly examples throughout the text • Fully updated exercises and examples throughout • Improved instructor resources, including complete solutions, an Instructor's Manual, and PowerPoint lecture outlines
